Experience & Projects

- An ERP (Enterprise Resource Planning) system is a software platform that integrates all aspects of a business, including Users & Roles, POS (Point of Sale), CRM (Customer Relationship Management), Operations, training & instructors, financial management, and Human Resources. The Users & Roles module controls access and permissions for different levels of users within the organization. The POS module allows businesses to process sales transactions, manage inventory, and generate reports. The CRM module helps manage customer interactions, leads, and sales pipelines. The Operations module streamlines processes such as procurement, production, and supply chain management. The training & instructors module helps manage employee training, track progress, and ensure compliance. The financial module includes features for accounting, billing, and invoicing. The Human Resources module manages employee data, payroll, benefits, and performance reviews. All these modules work together to provide a complete view of the organization's operations, streamline workflows, and optimize decision-making.

- A fingerprint system is a biometric identification technology that uses an individual's unique fingerprints to verify their identity. In this specific scenario, a fingerprint form machine is used to capture employees' fingerprints, which are then saved in an Access database. This database is then synchronized with a MySQL database hosted on a live server, which is integrated with an ERP system. The ERP system allows for real-time monitoring of employee attendance and punctuality. Reports can be generated based on the fingerprint data, including attendance reports, overtime reports, and leave reports. The system also features an auto-deduction feature based on employee tardiness or absence, which can be configured to comply with the company's HR policies. The system is designed to improve HR efficiency by automating attendance and punctuality tracking, eliminating the need for manual input and reducing

- Traffic (**The Hashemite Kingdom Of Jordan**)(**Krooka**) (Admin Panel - APIS) - It is a mobile application through which the citizen submits a request to the Traffic Department regarding the existence of an accident, then he contacts the policeman and the ambulance on another application, and it is in a follow-up process through the two parties - A admin panel dedicated to follow-up by the Traffic Department. It follows up the locations of accidents and the possibility of accumulation on the maps as a result of these accidents, and follows up the locations of the policemen and the locations of citizens, moment by moment (Real Time), on maps of the admin panel, as well as the possibility of sending missions to the policemen through the panel and following them up, specifying the location of the task in detail, with the possibility of sending notifications , Many other details within the system to manage car accidents within the country kroka.ai-solutions.online
- Real Estate Management System (**AYEN**) Real estate review and inspection system. Designs can be added appropriately to each one, and it is used more than once according to the model, whether an apartment or a villa, and everything inside the unit is evaluated from the system (electricity, plumbing, and so on..) and in the end, after completing all the evaluations, a unit inspection report is issued and sent to the customer ayen.ai-solutions.online
- Kenda Delivery: The system provides real-time tracking of orders and drivers, ensuring efficient and timely deliveries to customers. Customers can easily place their orders through the mobile app, making the process more convenient and accessible. The system allows for seamless communication between the restaurant, drivers, and customers, minimizing errors and delays in deliveries. The control panel offers a comprehensive overview of all orders, drivers, and restaurants, enabling the system administrators to manage the process effectively. The system is designed to handle a large volume of orders and drivers, making it suitable for scaling up as the business grows. By using the Kenda delivery system, restaurants can expand their customer base and increase revenue by offering delivery services without the need to manage their own delivery fleet. The drivers working for the system can benefit from a flexible schedule and additional income opportunities by delivering orders on their own schedule. The system can provide valuable data insights to restaurants, such as popular menu items, customer preferences, and delivery performance, helping them to optimize their operations and improve customer satisfaction. kenda-delivery.ai-solutions.online
- A clinics management system is a software application designed to help medical clinics manage their day-to-day operations, including patient scheduling, electronic medical records (EMR), prescription management, and billing. The system provides an efficient way for healthcare providers to store and access patient data, streamline workflows, and improve patient care. Some common features of a clinics management system include: Patient registration: The system allows clinics to register new patients and maintain their demographic and insurance information. Appointment scheduling: The system enables clinics to schedule and manage patient appointments, including automated appointment reminders. Electronic medical records (EMR): The system allows clinics to

store and access patient medical records electronically, including diagnosis, treatment plans, and lab results. Prescription management: The system provides a way for clinics to manage prescription orders and refills, including electronic prescription submissions to pharmacies. Billing and claims management: The system allows clinics to manage patient billing and insurance claims, including generating invoices and tracking payment status. Reporting and analytics: The system provides clinics with detailed reports and analytics on patient care, appointment scheduling, and financial performance.
